Product Description

Product Description

Emerson VE4036P2 DeltaV Redundant M-series Interface Module

Technical Application

The Redundant Serial Interface consists of a pair of serial cards and a redundant terminal block. The cards each contain two serial communications ports that support RS422/485 half duplex (in either single slave or multi-drop configurations), or RS422/485 full duplex (in single slave configuration only), as well as RS232. These ports are individually configurable and support data rates up to 115 Kbaud. The active and standby serial cards are each connected to serial ports on the slave device using the redundant terminal block. Verify with the device supplier for its ability to support redundant Modbus serial communications. When a fault is detected, the system automatically switches to the backup serial card. Events that can cause a switchover include:

Hardware failure within the active card

Communications failure (including field cable and slave port problems) between the active card and the controller

Removal of the active card from the carrier
